Project Description

This project required the provision of all labor, materials and equipment to repair several asphalt roads and parking lots at USCG Base Alameda. All overlay work included correcting the contour of the old pavement to allow the best possible grading for drainage into the existing storm drain system. Specific elements of work included grinding and removal of an average 2 inches of the existing asphalt layer, regrading of the subgrade where applicable, placing a glass-fiber geosynthetic fabric, and the placement of a new 2-inch asphalt layer. In total, 5,000 square yards were completed under the Base Bid for this project and an additional 9,340 square yards were completed through the award of four Optional Bid items. Thermoplastic restriping to original striping patterns and the reconstruction of the ground loops controlling the barricades at the front gate were also completed. Sustainable Group key personnel performed on-site construction management, field superintendence, safety oversight, and Quality Control/Quality Assurance (QA/QC) services throughout the duration of this project that was completed in eleven days without any safety or quality control incidents of any kind. This is especially significant given the high operational tempo at Base Alameda and the constant traffic to include large vehicles entering and exiting the Base.
