Project Description

The existing electrical shore ties at Station Morro Bay suffered multiple intermittent issues over the last few years that severely impacted Coast Guard operations. Specifically, Station personnel had to reportedly start and run the 47' motor life boats every 6 to 8 hours in order to keep the battery banks charged. This project sought to correct these issues and required the construction of a complete electrical shore tie distribution system to include all system wiring, raceways, pull boxes, terminal cabinets, outlets, mounting boxes, and other accessories and miscellaneous items required for a complete operating system. In addition, the project required coordination and a permit application to both the City of Morro Bay and to Pacific Gas and Electric. Originally, the design documents for this project showed the conduit for the new wiring to be run along the top of the pier, however the Coast Guard changed the design and then required the conduit to be run beneath the pier. This routing proved to be significantly more difficult and required the use of work floats to successfully install the conduit and wire. Despite this significant change, Sustainable Group absorbed the additional labor required and still completed the project within the original budget.

Sustainable Group key personnel also performed all on site work as well as on-site construction management, field superintendence, safety
