Project Description

This project required the provision of all labor, materials and equipment to repair an 800 square foot area of broken concrete, delineation of the underlying sinkhole area (caused by the consistent wave action of Puget Sound), re-compaction of the subgrade, placement of Controlled Density/Engineered Fill, pressure grouting of adjacent slabs, and placement of a new 8-inch-thick reinforced concrete slab. Other work included the removal of over 2,000 linear feet of railroad track followed by the preparation of the existing base course for re-paving, filling of pavement cracks, regrading as necessary to ensure adequate site drainage, placement of geotextile fabric, resurfacing with two inches of new hot mix asphalt, and restriping. In total, approximately 60,000 square feet of the active (and occupied Base) were repaved which was done in four phases to limit the impact to base operations as much as possible. Likewise, several elements of work were performed simultaneously to complete the construction portion of the project in only three weeks without safety or quality control incidents of any kind. Sustainable Group served as the General Contractor, the Project Manager, the Field Superintendent, and self-performed a large portion of the work to include the sinkhole repairs and the removal (and recycling) of the railroad track.
